

UNIFIED FITNESS

Product Concept Overview & MVP Strategy

EXECUTIVE SUMMARY

Modern fitness tracking is heavily fragmented. Hybrid athletes and multi-sport gym-goers currently rely on 3 to 4 separate applications daily to track their workouts, cardio, nutrition, and daily activity. **Unified Fitness** solves this friction by consolidating Hevy-style strength logging, Strava-grade GPS tracking, AI nutrition logging, and daily activity rings into a single, ultra-simple, clutter-free mobile interface.

1. The Core Problem

- **App Overload:** Daily switching between **Hevy/Strong** (lifting), **Strava** (running/cycling), and **MyFitnessPal/MacroFactor** (nutrition).
- **Segmented Data:** Key fitness metrics, recovery status, and daily targets are scattered across different platforms with inconsistent dashboards.
- **UI Bloat:** Feature creep in incumbent apps creates messy, complex user experiences for lifters who want fast, frictionless tracking.

2. The Proposed Solution (4 Pillars)

Hevy-Style Weightlifting

Dynamic set/rep logging, live rest timers, auto-calculated volume, and visual muscle targeting.

Strava-Grade GPS Tracking

Precise route mapping, split metrics, and cardio summaries for runs, walks, and cycling.

Frictionless AI Macro Tracking

Multimodal nutrition logging via photo recognition, voice input, and natural text (e.g., *"3 eggs, sourdough, iced latte"*).

Unified Activity Rings

OS-integrated background tracking displaying real-time daily Active Burn, Exercise Minutes, and Stand/Move goals.

3. Key Differentiators & Target Audience

- **Primary Persona:** The **Hybrid Athlete**—anyone balancing resistance training with regular endurance or cardio workouts.
- **UI/UX Philosophy:** Extreme minimalism. Zero clutter, ultra-fast set logging, and unified analytics on a single dashboard.
- **Smart OS Integration:** Leverages native background Health APIs to offload battery-heavy processing and handle automatic hardware ring syncing.

4. MVP Development Plan & Architecture

Architecture & Tech Stack

- **Cross-Platform Mobile App:** Built with **React Native (Expo)** to write a single codebase that deploys natively to both iOS and Android.
- **Health API Layer:** Direct integration with **Apple HealthKit** (iOS) and **Health Connect** (Android) to auto-pull active calories, steps, and cardio runs for the activity rings.
- **Over-The-Air (OTA) Updates:** Powered by **Expo EAS Update** to deploy instant UI updates and bug fixes directly to users without waiting for App Store or Google Play re-review cycles.

Core MVP Scope (V1)

- **Activity Ring Dashboard:** Visual daily rings powered directly by native Apple/Android health data.
- **Streamlined Strength Logger:** Searchable exercise library, set/rep/weight logging, and a floating rest timer.
- **Multimodal AI Macro Logger:** Text, voice, or photo input parsed instantly into calories and macros via an LLM API.
- **Synced Cardio Runs:** Import GPS route maps and metrics directly from HealthKit/Health Connect (skipping custom GPS engine overhead for V1).

Cost Structure

- **Developer Accounts:** \$99/year (Apple Developer Program) + \$25 one-time fee (Google Play Console).
- **Backend & Infrastructure:** Pay-as-you-go LLM API tokens for natural language food parsing + minimal cloud hosting server costs.
